Hessisches Kompetenzzentrum
für Hochleistungsrechnen

Modeling of Turbulence Interface Interactions in Two-Fluid Systems

Researchers
Dr. Ing. Marta Waclawczyk and
Dr.-Ing. Tomasz Waclawczyk

Project Term
2015 - 2015

Project Areas
Heat Energy Technology, Thermal Machines, Fluid Mechanics

Clusters
Lichtenberg Cluster Darmstadt

Institute
Chair of Fluid Dynamics , Fachgebiet Numerische Berechnungsverfahren im Maschinenbau

University
Technische Universität Darmstadt

Funded by

Deutsche Forschungsgemeinschaft

Introduction

During this project the statistical model put forward in (Waclawczyk, Oberlack) [1] is investigated. The new approach allows to relate the model for evolution of the intermittency region (IR), which is the domain where the interface can be found with non-zero probabilty, with properties of the bulk turbulent fluid.

Methods

Present studies have led to formulation and verification of the Favre averaged IR evolution model (IREM) and the new discretization for the conservative level-set (CLS) method, providing a framework for IREM implementation.[2,3] At first, the *a priori* study of DNS data obtained from simulations on Lichtenberg cluster with the Fastest code and the VOF method [4] was carried out, during these simulations up to 64 processes were used.

Results

As the result, velocity and pressure fields of the 2D vortex interacting with the flat air / water interface in the turbulent flow regime were obtained and used in the statistical analysis of the velocity interface correlations.[2,5]

Outlook

The next step in the developement of IREM is coupling with the

flow solver and the CLS method, [3] the preliminary works were performed in (Kraheberger; Waclawczyk et al.). [5,6] For future tests of the IREM model an access to the computational resources of HHLR is required.
